

Top Quality Industrial LED Display's

Mimic Component's add another top quality big digit display unit using large bright 180mm digits to their range.

These units are ideal for factory's etc requiring a **large clear display**.

The bright red LED digits can be read from approximately 100m away (depending on ambient light).

Models are available to operate off a variety of input signals :- e.g. 4-20mA, 0-10V, B.C.D. etc....

This unit aswell as the already popular 100mm digit display are also available as elapsed time indicators, up/down counters, 24 hour clocks & modbus.

The range of clocks/counters were designed specifically for the industrial market for time & counter applications.

These modules can be supplied with up to six digits & with count/time back up on power failure.

All inputs are isolated via opto-couplers giving the units flexibility with regards to input voltage.

All the units are fitted in a rugged powder coated aluminium enclosure with wall mounting brackets on the sides.

All the displays use red high bright seven segment LED displays giving excellent visibility over a large viewing area.

The battery back-up function keeps the last-count or the time & blanks the display until the main supply is restored & then continues to function normally. Therefore re-adjusting the time or count is not required after a power failure.
