

PCB Terminal Blocks

While industrial controls become more & more complex & important, the interface modules are utilized as the improved solution to replace traditional wiring usage. The diverse interface units are taken to convert signal between flat ribbon connector with screw type terminal, D-Subminiature connector with screw type terminal, and the relay with screw type terminal.

By applying wire technology & compact design, the interface units provide advantages on integration, space saving, flexibility and costing efficiency. The interface modules, which are widely adapted are considered the simple, convenient, economic and tech-oriented alternative for all common PLC's.
