

Magnetic Strobes

Flashing Light with magnetic base

Mimic Components now offer two versions of the popular magnetic base lights with plug for cigarette lighter. The zenon (Model AXE) and LED (Model AXD) strobes are both compact units, and are approximately 100mm high.

Model AXE - This Zenon strobe is slightly brighter and more visible in direct sunlight but reaches half the brightness in 10 million cycles (even though our strobe flashes slower than others, this is still reached in 72 days of continuous flashing). It is suitable for 12VDC, and is available in Red, Yellow, and Green.

Model AXB - This new LED strobe with encapsulated electronics is suitable for IP66 applications, with a life expectancy of 5 years at any rate of flashing. Powered by any voltage from 12 - 24V, with several variable flashing patterns, the magnet is extremely strong and this robust unit offers excellent value and top quality.
